INFORMATION ABOUT THE COMPANY

COMPANY

The company PLOSKON AT is an innovative enterprise with operations worldwide. The abbreviation AT means Parts for Automation. The centre of company's activities is in development, production and sales of the high-quality sensor technique for industrial use.

PLOSKON AT has been dealing with inductive proximity switches for more than 20 years. Today, as a specialist in this field we are able to offer you wide production programme.

The company domicile is situated in Prešov, Slovak Republic.

PLOSKON AT s.r.o.
Jesenná 1

E-mail: marketing@ploskon.sk
Web: www.ploskon.sk

The company PLOSKON AT has been established in the year 1990. Its activities and development are directed according to the simple idea of harmonizing of production processes and boosting productivity while preserving the lowest possible production costs at the same time. Our production effectiveness is based on economically paying production management methods.

All our products and our developments are customer orientated. We also get benefit from the practical experience acquired from the direct contact with the customers ourselves. The knowledge acquired in this manner is then used e.g. in development of new products.

Of course, we put a lot of time and attention to the customer consultations, which are important just by the challenging projects and products.

After all, a short phone call is not enough when it comes to the problem resolution.

We are watching new trends in automation and respond to them quickly and flexibly. By means of our ability to concentrate on the core of our knowledge we are able to consider requirements of the market quickly and offer "tailored" solutions to almost every request.

It is obvious for us to keep the quality and reliability of our products at the highest level possible, which is guaranteed by the high-tech production process as well as by the advanced quality assurance system.

Your ideas can be put into life only with the right partner on your side. Long-term experience in development and production of inductive proximity sensors make PLOSKONAT to be a competent and reliable partner that offers you besides other things also certainty by means of customer service and customer care included. We go along with you from the first contact till successful

RESEARCH AND DEVELOPMENT

New products are created in close cooperation with their users. That is why we are mostly ahead in development of our products and are able to concentrate on actual requirements of the market as well as realize special ideas of our customers. There are plenty of eloquent examples in proof of abilities of our research and development team.

COMPANY OBJECTIVES

Company PLOSKON AT thinks of its customers as partners and is always interested in long-term cooperation. That is why we always involve our complete know-how to find the best possible solution for you. We keep continuing to act in favour of our customers, because this is the way how the best solutions, both technically and economically, originate.

YOUR SUCCESS IS OUR OBJECTIVE

TECHNICAL INFORMATION

OPERATING PRINCIPLE

Inductive proximity switches are used for the monitoring of the presence of metal objects. They function as contact less substitution for the mechanical limit switches.

An inductive proximity switch is based on the **principle** of the resonance circuit quality changes. The switch consists of the following basic units: an oscillator, a detector, a trigger circuit, a power amplifier stage and protective circuits. An incorporated LC resonant circuit of the oscillator generates an electromagnetic scattered field. The field forms around active face a spatially limited zone that is considered to be the active switching zone (see Figure 1).

If an electrically conductive object is placed

within the active switching zone, the eddy currents induced in the object extract energy from the oscillator. As a result, a reduction in the oscillation amplitude occurs and the oscillator becomes damped.

If the conductive object is removed from the active switching zone, the oscillation is restored. Two states are possible: the oscillator oscillates (no conductive object present in the active switching zone), or the oscillator does not oscillate (a conductive object present in the active switching zone). These states can be electronically evaluated.

Depending on the switch mode (normally open/normally closed), the output closes or opens, when the conductive object approaching the active switching zone.

TECHNICAL TERMS

Supply voltage U_c

Voltage range required by the switch to maintain its proper function.

Nominal voltage U_n

The supply voltage value at which all the other parameters are defined.

Supply current I_c

The current consumed by the switch from a power supply at the nominal voltage and the ambient temperature of 20 °C. It is the switch intrinsic consumption and does not include the current intensity flowing through the switch output.

Output current I_o

The current that can be taken from the output. If the switch is short-circuit proof, the output current value can double at short-circuit.

Nominal sensing distance S_n

An electrically conductive object can approach the active switching zone in the axial (direction of the axis) or in the lateral direction (perpendicular to the switch axis). The nominal sensing distance is the distance between the switch active face and the axially approaching conductive object at which the output state changes. It is defined at the nominal voltage and the ambient temperature of 20 °C by using a 1mm thick target of 11 370 grade steel with the surface equal the switch active face.

Effective sensing distance S_e

Considering the tolerance of the components used for the switch manufacture, the sensing distance values differ and are delimited by the effective sensing distance. It is measured according to the norm IEC 947-5-2 at nominal voltage and nominal ambient temperature. In our sensors the effective sensing distance usually ranges as follows: $0,8 \times S_n < S_e < 1,2 \times S_n$

Hysteresis S_h

The difference between the operate (switch on) and release (switch off) point is called hysteresis. It is defined in the axial direction, at the nominal voltage and the ambient temperature of 20 °C.

Figure 2 gives the trigger curves and the hysteresis of the PSI 126 311 switch. Other switch type curves are almost identical; they differ only quantitatively.

Switching frequency f_t

This frequency indicates the maximum number of switching operations per second. Figure 3 shows method of determining the maximum switching frequency.

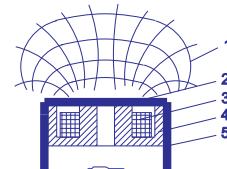

Operating temperature T_a

It is the ambient temperature range at which the reliable switch function is warranted.

Switch connection

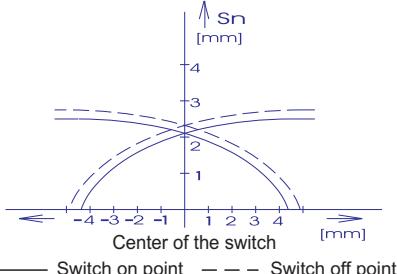

The output device is NPN or PNP transistor.

Fig. 1

1 - Active switching zone 3 - Switch coil
2 - Active surface 4 - Ferrite core
5 - Switch body

Fig. 2

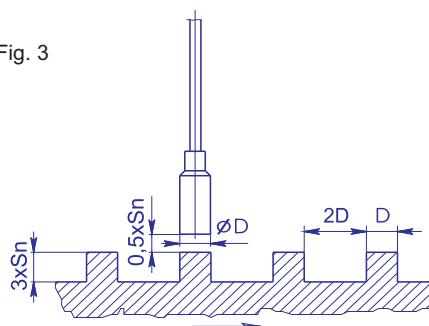

Sensing distance correction factors

ST 37-1,0 x Sn; steel-cca 1,0xSn; chrome nickel-cca 0,9xSn; brass-cca 0,5xSn; aluminium-cca 0,45xSn; copper-cca 0,4xSn.

Also different dimensions and thickness of the target can influence the sensing distance of the sensor.

Fig. 3

TECHNICAL

INFORMATION

MOUNTING AND OPERATION PRINCIPLES

Operation

Operation of the sensors is maintenance-free. For a fault free operation it is however necessary to keep the following principles: Surfaces of the active switching zone have to be kept free, clean. It is necessary to prevent sediments and other foreign particles from touching and setting up the active surface of the sensor, especially when mounted in upright position (active surface upwards). High electromagnetic field intensity devices (e.g. radiophone) must not be used in the immediate vicinity of the sensors.

Assembly of cylindrical sensors without thread

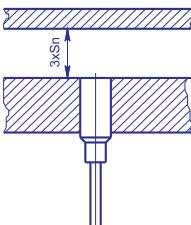

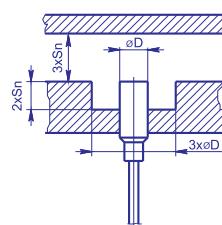

Non-threaded cylindrical sensors are mounted with help of clamps.

Assembly of cylindrical sensors with thread

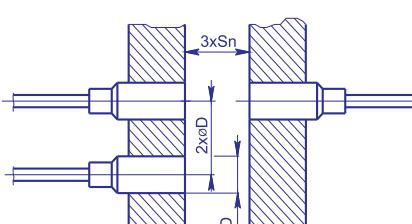

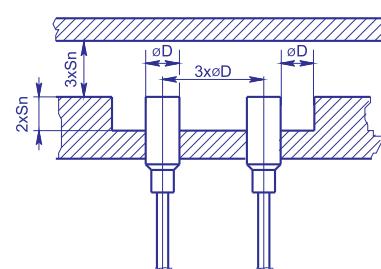

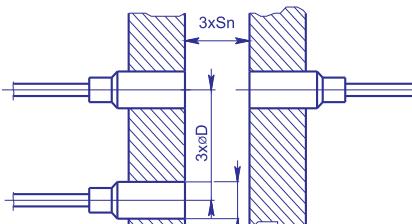

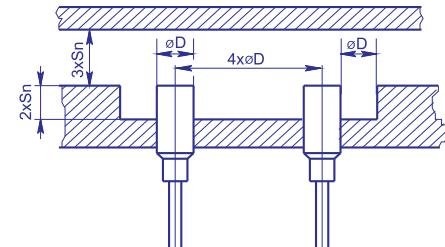

When assembled, threaded cylindrical sensors are placed into the fixation support where they are fastened by enclosed mounting nuts. If the thread in the fixation support is longer than the length of the thread of the sensor, it is recommended to drill a blind hole.

Assembly instructions for the cylindrical sensors

When mounting the cylindrical sensors into the metal it is necessary, in accordance with the standard EN 50008, to keep up to the following instructions for the flush and non-flush mounting:

FLUSH MOUNTING	NON-FLUSH MOUNTING
 <p>flush mounting</p> <p>The flush sensor is not sensitive to the neighbouring conductive objects placed at the side of the sensor. It can be fully let into the metal.</p>	 <p>non-flush mounting</p> <p>The non-flush sensor is sensitive to the neighbouring conductive objects placed at the side of the sensor. It is necessary to keep to the mounting instructions in the picture when mounted into the metal.</p>

When mounting cylindrical sensors of the same kind into the parallel connection, minimum distances among the sensors have to be observed:

<p>Flush mounting for the PSI / PAS series</p> 	<p>Non-flush mounting for the PSI / PAS series</p> 
<p>Flush mounting for the PDI series</p> 	<p>Non-flush mounting for the PDI series</p> 

UNWEAVE VOLTAGE

Sensors are protected from unweave voltage peaks. But if the higher values of unweave voltage are brought about by the customer, the power cable and the cable of the sensor must not touch each other.

TECHNICAL INFORMATION

RESISTANCE TO ELECTROMAGNETIC INTERFERENCE

The switch operation cannot be totally eliminated from the effects of electro-magnetic interference. It can affect switch circuit:

- through air and the resonance circuit coil
- through the device structure and the switch case capacitive coupling
- through the supply connection.

To avoid the electromagnetic interference, the switch circuit is provided with a filter which also affects the switching frequency of the switch. In general, resistance to electromagnetic interference is indirectly proportional to the switching frequency.

The switches of this catalogue are available as:

- basic models
- high-speed switches (the letter F follows the basic order reference number)
- low-speed switches (the letter S follows the basic order reference number)

CONNECTION OF A SWITCH TO AN ELECTRIC CIRCUIT

Switch connection must meet the high protection standard required and resist the high operation temperatures. The proximity switches specified in this catalogue are delivered with $2 \times 0,25 \text{ mm}^2$, $3 \times 0,25 \text{ mm}^2$ or $4 \times 0,25 \text{ mm}^2$ PVC cable in length of 2 m. This type meets the IP 68 enclosure class. Upon request, the switches are provided with a longer lead-in cable (scaled by 0.5 m).

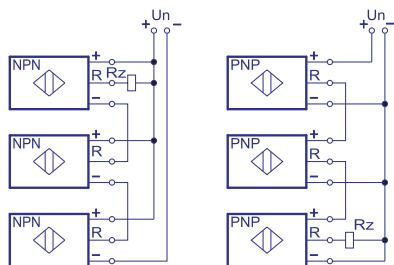

PUR cables are recommended for demanding applications.

The quick-disconnect version is provided with the connector type complying with the IP 67 enclosure class.

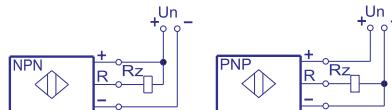

CONNECTION OF SENSORS

SERIES CONNECTION OF 3-WIRE SENSORS

Voltage drop in interconnected devices is added together. As a consequence less voltage is available. Each sensor has to be able to switch over current consumption of all subsequently connected sensors in addition to the current of the load. Switch off / switch on of one of the sensors will cause all other sensors to switch off / switch on. Switch on delays are also added together; consequently it is necessary to take account of the delay up to 100 ms.

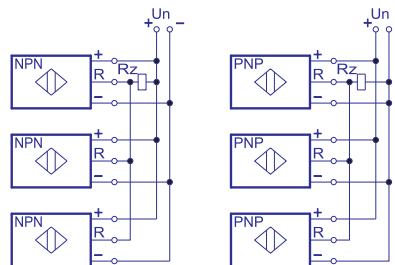

CONNECTION OF NPN and PNP OUTPUTS

PARALLEL CONNECTION OF 3-WIRE SENSORS

Current input of all non-connected sensors is added together. Sensors can be used together with the use of mechanical switches.

EXAMPLE OF SENSOR MARKING

PDI - series with double switching distance

PSI - series with standard switching distance

STANDARDS AND LICENCES / ELECTROMAGNETIC COMPATIBILITY/ ROHS

Sensors of the company PLOSKON AT are developed, manufactured and tested in accordance to the valid standards and regulations. They conform to the currently valid IEC regulations, EN standards and DIN VDE regulations, e.g.:

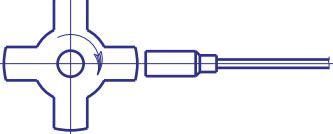

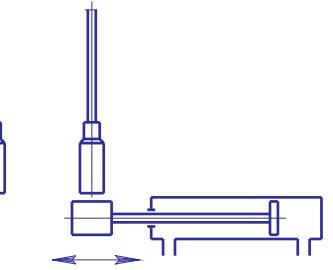

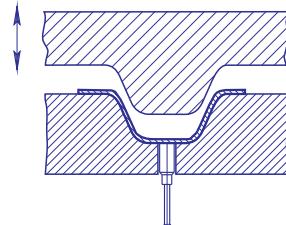

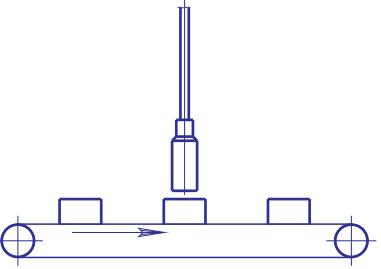

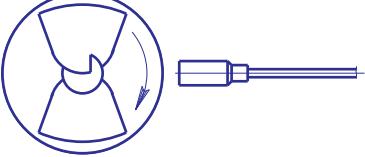

- European Standard No. **EN 609 47 - 5 - 2** of October 1, 1997 and **EMC Directive No. 89/336/EEC** (relating to the electromagnetic compatibility); sensors are also being manufactured in accordance with safety and health provisions related to the design and construction of electrical devices.
- Directive on the Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment 2002/95/EC[1] (commonly referred to as **RoHS** or the Restriction of Hazardous Substances Directive) that was adopted on January 23, 2003 by the European Union.

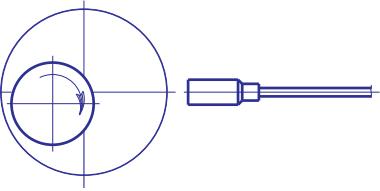

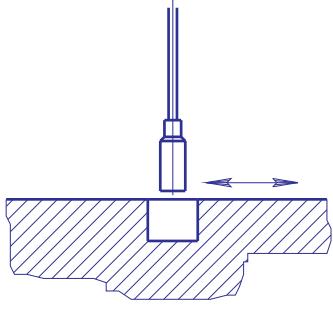

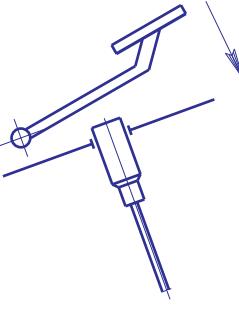

APPLICATIONS

ROTATION CONTROL	LINEAR MOTION
 <p>Inductive proximity switches can be used for the sensing of the following objects and phenomena:</p> <p>Rotation control. The number of positions can be determined by the number of projections.</p>	 <p>Linear motion detection, e. g. a piston position in a cylinder.</p>

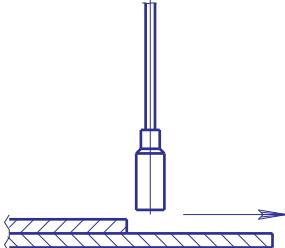

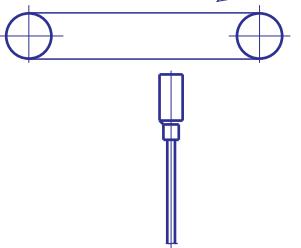

PRESS WORK PRESENCE	PRODUCTS ON A CONVEYOR	TURBINE REVOLUTIONS
 <p>Detection of press work presence in a device.</p>	 <p>Products detection on a conveyor, e. g. counting, form/position detection.</p>	 <p>Sensing of turbine revolutions.</p>

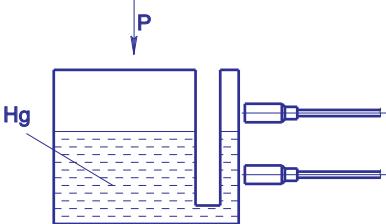

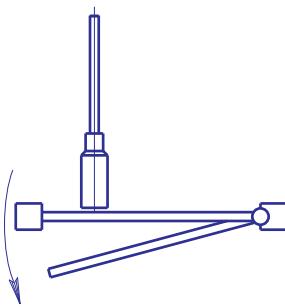

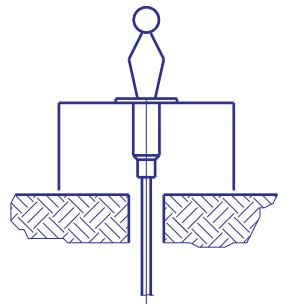

REVOLUTIONS	APPERTURE	SWITCH POSITION
 <p>Sensing of revolutions by an eccentrically located cylinder.</p>	 <p>Detection of an aperture in material.</p>	 <p>Switch position detection. E. g. a foot pedal in heavy-duty operation conditions.</p>

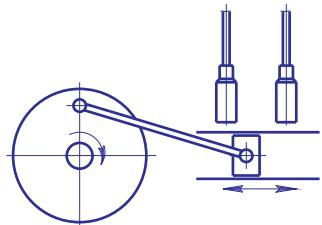

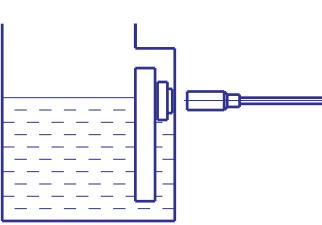

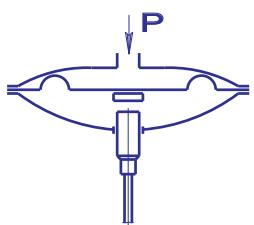

APPLICATIONS

Inductive proximity switches can be used for the sensing of the following objects and phenomena:

MATERIAL THICKNESS	CHAIN SAG
 <p>Material thickness measurement, e. g. double sheet control.</p>	 <p>Detection for a chain sag and chain ware.</p>

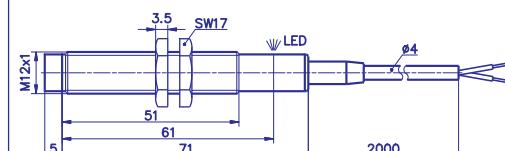

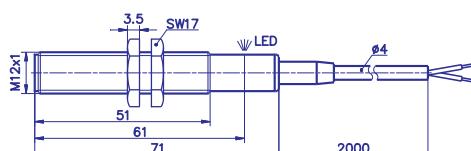

PRESSURE	DOOR POSITION	OBJECT PRESENCE
 <p>Pressure control by mercury level monitoring.</p>	 <p>Door position detection, e. g. rooms, lockers, safe-deposit boxes protection.</p>	 <p>Sensing of object presence, e. g. protection of exhibits.</p>

ROTARY MOTION	LIQUID LEVEL	PRESSURE
 <p>Detection of rotary motion converted to linear motion.</p>	 <p>Liquid level control by a float.</p>	 <p>By means of a suitable gearing there is a possibility of a precise pressure monitoring.</p>

INDUCTIVE SENSORS

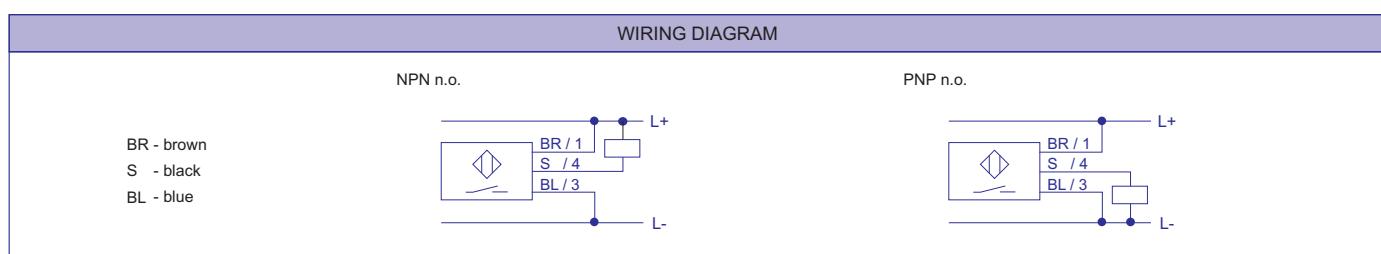

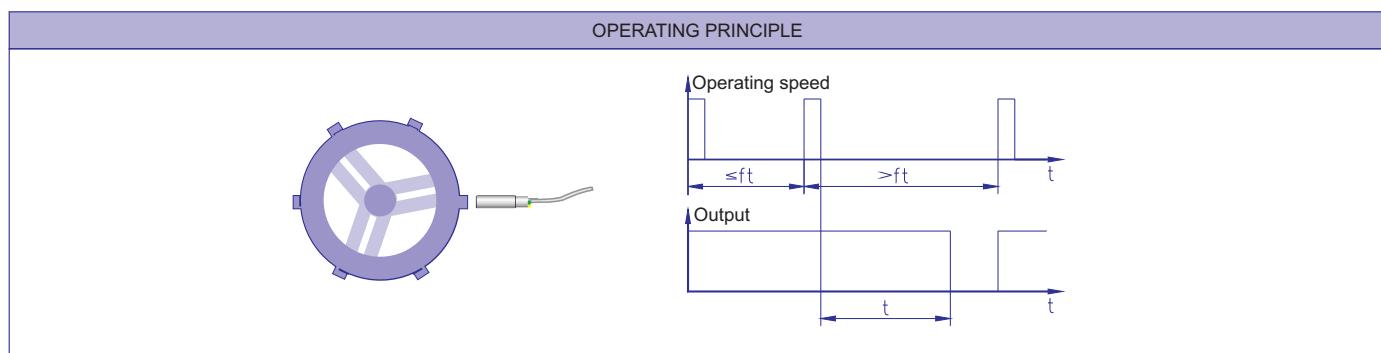

OF ROTATION

series PSI RSx

DESCRIPTION OF OPERATION

Sensors of rotation are intended for monitoring of revolutions or speed. They are suitable especially in case of decentralized control. Inductive rotation sensors perform contactless monitoring of changes of revolutions compared with their reference value.

A **possibility to select reference revolutions** is the extraordinary feature of the PSI RSx inductive rotation sensors.

Unlike the standard way of adjustment by potentiometer, adjustment of these sensors is based on principle of real measurement of reference revolutions. Increase or decrease of revolutions is signalled in regard to limit values of revolutions that are defined as a percentual change of the measured reference revolutions.

Permitted percentual change is selected through the order number of the sensor.

	RSA	RSD	RSE
Signal to measure reference revolutions	Automatically ⁽¹⁾	Manually ⁽²⁾	
Memory of reference revolutions	Temporary ⁽³⁾	Permanent ⁽⁴⁾	
Monitoring of decrease of revolutions	Yes ⁽⁵⁾		Yes ⁽⁶⁾
Monitoring of increase of revolutions	No		Yes ⁽⁶⁾
Number of inputs	0		1
Number of outputs		2 ⁽⁷⁾	

NOTES:

1. Automatically after stabilization of revolutions.
2. Manually by means of sensor input.
3. Value of reference revolutions will be lost after supply disconnection of the sensor.
4. Value of reference revolutions will remain preserved even after supply disconnection of the sensor.
5. Two limit values are available.
6. One limit value is available.
7. There is one output for each limit value.

APPLICATION EXAMPLES:

- Signalising of decrease or increase of revolutions.
- Delayed signalising of revolutions decrease or increase after device activation. (It will prevent false signalising during run-up of monitored device, until revolutions reach nominal value.)
- Signalising of wear (small revolutions decrease) in advance of signalising of failure (substantial revolutions decrease).
- Sensing of decrease of revolutions during the starting up of the monitored device in advance of nominal revolutions achieving.

More details available upon request.

ORDER REFERENCE NUMBER
PCO - 810 10 13

APPLICATION
<p>The detector operates on the basis of an optical barrier. Rays connecting the transmitter and receiver are interrupted by a passage of a detected object. On the basis of a number of screened receivers the subsequent operating system evaluates the passage of the object.</p> <p>Generally, the detector can be used for object counting, for distinguishing objects by the size or detecting of the passage of several objects in co-operation with the operating system.</p>

VEHICLE DETECTOR

		TECHNICAL PARAMETERS
SUPPLY VOLTAGE	Un	24 V ± 10% DC/AC
SUPPLY CURRENT	I _c	< 65 mA
NUMBER OF CONNECTED LOOPS		1
LOOP INDUCTIVITY		25 - 800µH, recommended 100 - 300µH
FREQUENCY RANGE	f	25 - 130 kHz (depending upon the loop inductivity, two settings)
SENSITIVITY		0,1%, 0,04%, 0,16%, 0,64% ($\Delta f/f$)
NUMBER OF OUTPUTS		2
CONTACT TYPE OF THE RELAY No. 1		n.o. / n.c. → presence relay
CONTACT TYPE OF THE RELAY No. 2		n.o. → signal duration 200 ms after vehicle have left the loop
RELAYS CONTACT RATING		250 m A at 24VAC/DC
AMBIENT TEMPERATURE RANGE	T	-20°C...+70 °C
STANDARD DIMENSIONS OF THE LOOP [mm]		1200 x 2000
WEIGHT		cca 100g
MOUNTING		35 mm DIN rail

ORDER REFERENCE NUMBER

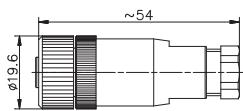

PAS 709 48 FG1

LOOP	
<p>The detector incorporates a loop to be embedded into a slot miled out in the road, maximum 50 mm under its surface.</p> <p>Standard dimensions of a loop are 1200 x 2000 mm. Length of the loop can be changed according to the width of the road. It can be embedded longitudinally or crosswise.</p> <p>When needed, the switching range and the operations frequency of the detector can be changed by the customer. (To be utilized when several loops are placed next to each other.)</p> <p>Detailed information about loop embedding and detector settings can be found in service manual.</p>

M18	30,0 19,0 1,8	P 18
M30	48,0 31,0 1,6	P 30

The switch is subject to equipment vibrations that may result in its loosening and subsequent mechanical damaging.
This can be prevented by application of spring washers. J-Form zinc-coated washer is complying with DIN 6798.
